

HoneyMoney

Funding transparency. Spending autonomy. A personal financial wellness app — AI-supported, no tracking fatigue.

The problem

Money is the **#1 source of conflict** in Malaysian households, and that stress reaches work as lost productivity — an estimated **~9 lost productive days per employee per year**. Budgeting apps surveil every ringgit, demand manual entry until users quit, and store data too flat to warn before a goal slips.

Our solution

HoneyMoney models a household's money as a **living knowledge graph** under a **3-Bucket method**: **Must-paid** (rent, bills), a **Savings** auto-allocation percentage, and a **private Spendings bucket where tracking stops**. Because the graph knows how income flows into buckets and out to real spending, our AI companion "**Honey**" sees structurally when one bucket's spending velocity will push a shared goal later — and nudges *before* it happens, for one person, two partners, or a whole family. Capture is frictionless: scan a receipt or drop an e-wallet screenshot and **on-device OCR and voice consume no AI tokens**, never leaving the device.

Why it's technically credible

One graph engine serves **a solo earner with freelance and shop income, a couple, and a family** with zero schema changes — three live personas; the demo adds one household per **H-Score band**. AI is **swappable and optional** across Google Gemini Flash, Groq and local Ollama, with a per-call token ledger — and **every figure a household reads is produced by a deterministic function, not by the model**. The stack is **self-hostable**: one PocketBase binary plus a Next.js app. Settings are encrypted at rest, household-supplied AI keys are encrypted (**AES-256-GCM**) before storage, and backups are encrypted off-site.

Market & model

A free consumer tier grows by family referral; revenue is **budgeting goals and insights as a service** — employers sponsor seats like health cover, households never pay, premium optional. **Employers see trends, never records**. Licensed, opt-in referrals come later. Near-zero infrastructure cost; near-100% gross margin. **Cradle CIP Spark** is our non-dilutive entry.

Impact

Financial resilience for underbanked households, less money-driven conflict, healthier workplaces — mapped to **SDG 1 (No Poverty), 3 (Good Health), 8 (Decent Work)**, the **BNM financial-inclusion agenda** and Malaysia's **MADANI** agenda.

Status

Live at **honeymoney.app**, served **24/7** from Cloudflare's Singapore edge. Shipped: dashboard, six-view knowledge-graph gallery, **H-Score** scoring, **Ask Honey**, multi-currency and multi-language capture, itemised zero-token on-device receipt scanning, household AI keys, a **bilingual PDPA notice with per-purpose consent and one-click export**, restore-tested off-site backups and a cost/AI-token ledger — with a genuine, non-backdated commit history. Team & ask

Team JUST50 — two leads. **Business Lead (Malaysian citizen, MyKad holder)** drives strategy, partnerships and growth. **Tech Lead** (full-stack and AI engineer, Singaporean) architects the platform. Built in the open. **We are looking for**: pilot partners — employers and community groups offering HoneyMoney as a wellbeing benefit; licensed fintech partners for the Year 3 referral layer; and impact-driven investors.
